GIT-APE - TRACK 1 - ZERO TO DEPLOY

Deploy Azure Infrastructure

With a Single Sentence

A 30-minute hands-on intro for enterprise teams

No cloud expertise needed | Runs in your browser | Hands-on lab

AI-powered cloud deployment

6 slides | 30 minutes | Beginner friendly

What Is Git-Ape?

Deploy Azure infrastructure with a sentence

The idea

- An **AI assistant** that turns plain English into production-ready Azure infrastructure
- Built on **GitHub Copilot** - works in VS Code or the browser
- Handles **security, cost estimation, and architecture** automatically
- **No cloud expertise required** for the requester

From sentence to deployment

Cost estimate and architecture diagram come for free.

How It Works

A conversation, not a configuration file

Four steps, in plain English

1. **You describe** what you need
2. **Git-Ape asks** clarifying questions - region, environment, project name
3. **Git-Ape generates** the template, security report, and cost estimate
4. **You confirm** - it deploys, or you keep the artifacts without deploying

Sample conversation

```
@git-ape deploy a Python function
app for the inventory project in dev
```

→ Region? **eastus**

→ Storage SKU? **Standard_LRS**

→ Enable monitoring? **Yes**

Security pass **Cost ~$0.40/mo** **Diagram**

Use your own words. No forms. No wizards.

What You'll Build Today

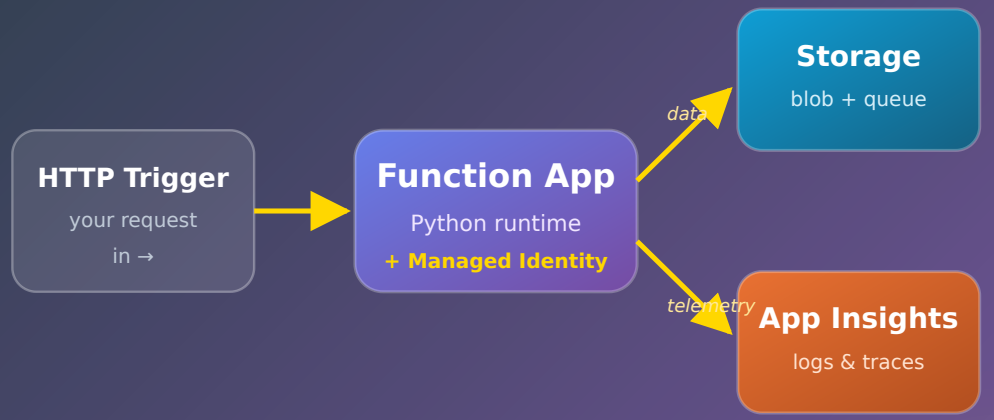

A Python Function App on Azure

Resources

- **Function App** - serverless, runs your code on demand
- **Storage Account** - backing storage (blob + queue)
- **Application Insights** - built-in monitoring & logs
- **Managed identity** - no passwords stored anywhere

Serverless | ~$1/month light use | Identity-based auth

Architecture

All connections use managed identity — zero secrets in code

Let's Go!

Set up your environment in 2 minutes

GitHub Codespaces

Browser only
~30s if cached
Zero install

Recommended for first-time users

Dev Containers

VS Code + Docker
Tools pre-installed
Local environment

Best for offline use

VS Code Local

Your machine
Install tools manually
Full control

For experienced users

Container-based options ship with Azure CLI, Bicep, GitHub CLI, Node, Python, .NET, and every Git-Ape skill pre-installed. Open the lab guide and start with **Lab 1: Setup**.

Recap & Next Steps

What you just did

In 30 minutes you

- Deployed Azure infrastructure with **one sentence**
- Got an automatic **security review** with a blocking gate
- Saw a **cost estimate** from real Azure pricing
- Generated an **architecture diagram**

No ARM templates written **No portal clicks**

Where to go next

Track 2 - Deploy Like a Pro

Multi-resource architectures, security deep dive (60 min)

Track 3 - Platform Engineering

CI/CD, headless mode, policy compliance (90 min)
